Introduction

The Spooky**2** Rife System is used mainly for human and animal health. Using leading-edge quantum physics techniques combined with the signal transmission/reception properties of DNA's dual helical coils, it's capable of killing pathogens, parasites, molds, and cancer cells in the body, removing toxins and heavy metals, and normalising organs and body systems.

These techniques are also perfect for killing environmental infestations and molds.

The protocols

<u>Insects</u>:

Eradication requires a dead specimen of the infesting insect, preferably freshly killed so that its GI microflora is still alive. Place the corpse close to one end of the sticky side of a 2-inch length of specimen tape, then fold the tape over once lengthways so that the specimen is sealed inside. Slide the tape into the Spooky Remote between the two green circuit boards such that the specimen lies beneath the white circular magnet protection foam pad.

Now go to Spooky**2**'s **Environmental Preset Collection** and select the preset you wish to use. This will load the correct settings and frequencies for you. Tick the **Allow Channel Overwrites** checkbox, then click a pink/red **Generator Button**. The **Generator Control Panel** will open. When you click the **Start** button, the button turns green, showing that the preset is running. Run non-stop until successful.

Most small insect pests become most active around dusk, so you'll have a better chance of catching one at this time. You'll find bird mites on ceilings and the tops of walls close to the beds (for easy access to dinner, which is you). If you don't know what your pest looks like, use **<u>Google Image Search</u>** to help.

Species presets provided are *Bird Mites (R) – DB, Collembola (R) – DB, Dust Mites (R) – DB, Fleas (R) – DB, Grain Mites (R) – DB, and Household Insects (R) – DB*. Use *Spooky Spectrum Sweep (R) – DB* or *Spooky Converge Sweep (R) – DB* for rodent mites, unidentified pests, or in the unlikely event that the species preset produces no result.

<u>Moulds</u>:

Removal requires a specimen. You should wear a dust mask to avoid inhaling spores. Press one end of a 2-inch length of specimen tape firmly against a patch of mould so that a specimen sticks to the glue, then leave the area immediately. Fold the tape over once lengthways so that it's sealed shut. Slide the tape into the Spooky Remote between the two green circuit boards such that the specimen lies beneath the white circular magnet protection foam pad.

Now go to Spooky**2**'s **Environmental Preset Collection** and select the preset you wish to use. This will load the correct settings and frequencies for you. Tick the **Allow Channel Overwrites** checkbox, then click a pink/red **Generator Button**. The **Generator Control Panel** will open. When you click the **Start** button, the button, showing that the preset is running. Run non-stop until successful.

Presets provided are *Molds Species (R) – DB,* and *Molds General (R) – DB*. Two Spooky Central plasma presets are also provided – Mold Sweep 2-Day (P) – DB, and Mold Sweep 4-Day (P) – DB.

The *PM Molds Species* Preset targets Stachybotrys, Aspergillus, Alternaria, Fusarium, Botrytis, Chaetomium, Trichoderma, Hormodendrum, Cladosporium, and Penicillium. The *PM Molds General* Preset targets most household molds. It also attacks and destroys physical structures common to all household fungi and molds.
